BGP specifies a TCP-based communications method to help autonomous systems exchange routing information over the Internet. An AS is a collection of routers run by a common administration, such as a large enterprise or university, which control a range of IP addresses. Each AS is assigned an Autonomous System Number (ASN).

BGP is a standardized exterior gateway protocol (EGP), as opposed to RIP, OSPF, and EIGRP which are interorgateway protocols (IGP's). BGP Version 4 (BGPv4)is the current standard deployment. BGP is considered a "Path Vector" routing protocol. BGP was not built to route withinan Autonomous System (AS), but rather to route betweenAS's.

Border Gateway Protocol

The BGP, which RFC 1771 defines, allows you to create loop-free interdomain routing between autonomous systems (ASs). An AS is a set of routers under a single technical administration. Routers in an AS can use multiple Interior Gateway Protocols (IGPs) to exchange routing information inside the AS.

BGP Case Studies - Cisco

BGP Route Aggregation A router's primary function is to move packets from one network to a different network. A router learns about unattached networks through static configuration or through dynamic routing protocols that distribute network topology information between routers.

BGP persistence enables the router to retain routes that it has learnt from the configured neighbor even when the neighbor session is down. BGP persistence is also referred as long lived graceful restart (LLGR). LLGR comes into effect after graceful restart (GR) ends. Restrictions for BGP Persistence

What Is BGP? | BGP Routing Explained | Cloudflare

BGP Basics The main purpose of BGP is to exchange routing updates like other routing protocols, but BGP typically does not exchange individual network routes (but it technically can), it exchanges summaries of network routes. This is because the typical use of BGP is over very large networks including the Internet.
