You can get started with this table that sums up the main differences between plant and animal cells. This study guide is made for younger students, but this is a good way to brush up on what you already know about cells. You can then move on to this more comprehensive study guide about the different organelles.

Cell Parts 101: Plant And Animal Cell Helpful Study Guides

Plant cells are the basic unit of life in organisms of the kingdom Plantae. They are eukaryotic cells, which have a true nucleus along with specialized structures called organelles that carry out different functions. Plant cells have special organelles called chloroplasts, which create sugars via photosynthesis.

Membrane Structure. The plasma membrane on the outer surface of the protoplast regulates what enters and leaves the cell. Other membranes within the cell compartmentalize the protoplast, separating the interior into units of differing chemical composition, each with their own differentially (selectively) permeable membranes —membranes, like the plasma membrane, that selectively permit the passage of some materials while inhibiting the passage of others.

The cell wall is only found in plants and is an extra cellular structure that surrounds the plasma membrane and acts as the primary cell wall. It is extremely elastic. The plasma membrane is found in both animal and plant cells and controls the cellular traffic. It contains proteins that also allow materials to pass through it.
