This volume in The SAGE Reference Series on Disability explores issues involving assistive technology engineering and science. It is one of eight volumes in the cross-disciplinary and issues-based series, which incorporates links from varied fields making up Disability Studies as volumes examine topics central to the lives of individuals with disabilities and their families. With a balance of history, theory, research, and application, specialists set out the findings and implications of research and practice for others whose current or future work involves the care and/or study of those with disabilities, as well as for the disabled themselves. The presentational style (concise and engaging) emphasizes accessibility. Taken individually, each volume sets out the fundamentals of the

Human Factors, accompanied by compiled data and statistics, recommended further readings, a guide to organizations and associations, and other annotated resources, thus providing the ideal introductory platform and gateway for further study. Taken together, the series represents both a survey of major disability issues and a guide to new directions and trends and contemporary resources in the field as a whole.

In the 21st century Assistive Technology (AT) should be defined as a scientific and technologic approach to the development of products and services oriented to support the elderly and people with disabilities in their daily activities, maximizing their personal autonomy, independence, health and quality of life.

Assistive Technology Design for Intelligence Augmentation presents a series of frameworks, perspectives, and design guidelines drawn from disciplines spanning urban design, artificial intelligence, sociology, and new forms of collaborative work, as well as the author's experience in designing systems for people with cognitive disabilities. Many of the topics explored came from the author's graduate studies at the Center for LifeLong Learning and Design, part of the Department of Computer Science and the Institute of Cognitive Science at the University of Colorado, Boulder. The

members of the Center for LifeLong Learning and Design came from a wide range of design perspectives including computer science, molecular biology, journalism, architecture, assistive technology (AT), urban design, sociology, and psychology. The main emphasis of this book is to provide leverage for understanding the problems that the AT designer faces rather than facilitating the design process itself. Looking at the designer's task with these lenses often changes the nature of the problem to be solved. The main body of this book consists of a series of short chapters describing a particular approach, its applicability and relevance to design for intelligence augmentation in complex computationally supported systems, and examples in research and the marketplace. The final part of the book consists of listing source documents for each of the
