For the latter portion of the seminar we will introduce confirmatory factor analysis (CFA), which is a method to verify a factor structure that has already been defined. Topics to discuss include identification, model fit, and degrees of freedom demonstrated through a three-item, two-item and eight-item one factor CFA and a two-factor CFA.

1. One Factor Confirmatory Factor Analysis. The most fundamental model in CFA is the one factor model, which will assume that the covariance (or correlation) among items is due to a single common factor. Much like exploratory common factor analysis, we will assume that total variance can be partitioned into common and unique variance.
