The engine power output and torque are a function of the speed. Maximum power output occurs at 85.7 per cent of engines maximum speed, but above this speed starts decreasing due to poor volumetric efficiency at high speed. This match does not give a good torque-back up to provide good traction ability.

The BMEP is a theoretical calculated value that represents the average pressure inside the engine cylinder and provides a useful way of comparing relative engine performance. Cummins Power Systems Generator set datasheets and engine performance datasheets will always provide the BMEP value at rated load.

### TRANSIENT PERFORMANCE OF GENERATING SETS

A diesel engine's power at any RPM is controlled by how much fuel is metered into the injectors. This engine could produce 380 HP at 2,300 RPM, but since the propeller is only absorbing 250 HP, less fuel is being injected into the cylinders and less fuel means less power—even at the same RPMs.
