Introduction. Helminths are a broad range of organisms that include intestinal parasitic worms, (roundworms (*Ascaris lumbricoides*), whipworms (*Trichuris trichiura*), or hookworms (*Necator americanus* and *Ancylostoma duodenale*). Infected people excrete helminth eggs in their faeces, which then contaminate the soil in areas with inadequate sanitation.

Abstract. Nowadays, zoonoses are an important cause of human parasitic diseases worldwide and a major threat to the socio-economic development, mainly in developing countries. Importantly, zoonotic helminths that affect human eyes (HIE) may cause blindness with severe socio-economic consequences to human communities.

Zoonoses. All farm animals naturally carry a range of diseases, some of which can also affect humans. These diseases are known as zoonoses, and if you work with animals your health may be at risk from them. Zoonoses are caused by micro-organisms, which are subject to the Control of Substances Hazardous to Health Regulations (COSHH).

Parasitic worms, also known as helminths, are large macroparasites; adults can generally be seen with the naked eye. Many are intestinal worms that are soil-transmitted and infect the gastrointestinal tract. Other parasitic worms such as schistosomes reside in blood vessels. Some parasitic worms, including leeches and monogeneans, are ectoparasites - thus, they are not classified as helminths ...

Parasitic worm - Wikipedia

A recent report by the Department for International Development, UK (2012) noted that the most important zoonoses in terms of human health impact, livestock impact, amenability to agricultural interventions, severity of diseases and emergence are of a gastrointestinal zoonotic nature. Helminths represent the most prevalent macroparasite group of endoparasites and among infectious diseases helminthiases are regarded as a key issue.
