The Read Data from a Modbus/TCP Device COMMREQ requests a data transfer from a Modbus/TCP device to the PLC. The Read Data COMMREQ must reference an active Modbus/TCP channel previously established with the Open Modbus/TCP Client Connection COMMREQ. Registers, Coils or Exception Status data may be read from the remote Modbus/TCP device.

The Modbus TCP/IP driver is a powerful module designed with both Client and Server support, enabling easy connection to other Modbus TCP/IP devices (Modicon processors and many others). In combination with the GE Ethernet Global Data device support, the module provides a powerful interface to the many Modbus TCP/IP devices which are in use in the industrial marketplace today.

Modbus TCP encapsulates Modbus RTU request and response data packets in a TCP packet transmitted over standard Ethernet networks. The unit number is still included and its interpretation varies by application - the unit or slave address is not the primary means of addressing in TCP. The most important address here is the IP address.

The Modbus industrial protocol was developed in 1979 to make communication possible between automation devices. Originally implemented as an application-level protocol intended to transfer data over a serial layer, the protocol has expanded to include implementations over serial, TCP/IP, and the user datagram protocol (UDP).
