### Modeling Contact with Abaqus/Standard

In either case ABAQUS/Standard will consider the two bodies to be just in contact at the start of the simulation. As the allowable interference,  $\epsilon$ , is decreased during the step, ABAQUS/Standard pushes the surfaces apart until there is no more allowable penetration. There are three different ways in which to specify the allowable interference,  $\epsilon$ . By default, in all cases the value of the specified allowable interference is applied instantaneously at the start of the step and then ramped down to ...

### 29.2.4 Modeling contact interference fits in ABAQUS/Standard

If there are other contact pairs in the model with surfaces, ABAQUS/Standard uses the average dimension of all of the slave surface element faces. If there are no other contact pairs, ABAQUS/Standard uses a characteristic element dimension of the entire model. Models in which the contact face dimensions in a slave surface vary greatly.

### 21.2.1 Defining contact pairs in ABAQUS/Standard

Abaqus/Standard initializes the contact state based on the gap or penetration state observed in the initial geometry. Small initial contact overclosures are resolved by default using strain-free adjustments to the positions of surface nodes.

Overview of Contact in Abaqus 1. Contact Mechanics. In general contact is the study of deformable bodies that touch each other at least one point in the space. A 3D object may contact on a (or a series of) shared point(s) or surface(s). Contact mechanics, developed based on the continuum mechanics and mechanics of materials, is a theory to describe pressure and adhesion (normal) and friction (tangential) stresses that arise during shared points/surface contact between deformable bodies.

### Overview of Contact in Abaqus 1. Contact Mechanics

Modeling contact between rigid surfaces and rigid surface contact elements Determining the location of the areas of contact and the surface tractions between contacting structures are common goals of Abaqus simulations. Rigid surface contact elements can be used to model contact when one of the structures is assumed to be rigid.

In Abaqus/Standard, the primary formulation is surface-to-surface contact. Supplementary formulations include edge-to-edge, edge-to-surface and vertex-to-surface. As contact modeling has evolved, the transitions between active formulations have become automatic. Recent contact modeling developments in Abaqus include:
