Introduction. The book presents a wealth of material about the polar oceans, more specifically the ice-covered areas and peripheral seas. It provides a detailed history of the changing climate of the polar oceans as observed by satellite sensors in the last three decades. The satellite research data show spatial distributions of surface temperature, sea ice, albedo, chlorophyll concentration, clouds, ocean color and sea level pressure.

Colder regions are capable of absorbing more CO 2 than warm regions, so the polar regions tend to be sinks of CO 2 (see the North Atlantic and Arctic). As atmospheric CO 2 increases from the burning of fossil fuels, more regions of the ocean absorb CO 2 from the atmosphere, and the global ocean source and sink regions are no longer in balance.
