In depth analysis and design of crucial sub-system of proximity fuzes are given special importance. It also covers advances based on microwave frequency-modulated continuous wave (FMCW) systems and laser proximity fuzes. The instrumentation aspects of proximity fuzes are given due attention.

Proximity Fuzes: Theory and Techniques: V. K. Arora ...

A proximity fuze is a fuze that detonates an explosive device automatically when the distance to the target becomes smaller than a predetermined value. Proximity fuzes are designed for targets such as planes, missiles, ships at sea, and ground forces. They provide a more sophisticated trigger mechanism than the common contact fuze or timed fuze. It is estimated that it increases the lethality by 5 to 10 times, compared to these other fuzes.

Proximity Fuzes: Theory and Techniques. It has long been recognised that the efficacy of explosive projectiles would be greatly enhanced if these could be equipped with fuzes which would be actuated by the proximity to a target. For example, an anti-aircraft projectile which would automatically

CHAPTER 1 BOMBS, FUZES, AND ASSOCIATED COMPONENTS

INTEGRATED OPTOELECTRONIC FUZES The sensor in a proximity fuze for a missile or projectile application initiates warhead detonation when the projectile comes within a desired range from the target where the warhead will produce maximum damage. For optical sensors, range can be determined with geometric and opto-electronic ranging technologies.

ADVANCED OPTICAL FUZING TECHNOLOGY

Proximity fuzes for these applications may function as radio or electro-optical altimeters or as slant-range-sensing devices that measure range to the surface at the projected point of weapon impact. One means of signal selection makes use of the radar principle, in which the elapsed time between a transmitted and received pulse is a function of range between target and weapon.
