Induction motor starting methods and issues. Abstract: Many methods can be used to start large AC induction motors. Choices such as full voltage, reduced voltage either by autotransformer or wye-delta, a soft starter, or usage of an adjustable speed drive can all have potential advantages and trade offs. Reduced voltage starting can lower the starting torque and help prevent damage to the load.

Abstract: The performance of a voltage-controlled large induction motor soft starter has been improved, resulting in nearly perfect current and torque profiles. The performance analysis of the soft-starter motor-load combination has been carried out in the dynamic state using a hybrid induction machine model which takes account of disconnected two-phase and three-phase operational modes of the ...

Abstract: Utility company standards for power quality are making it difficult for industrial users to start large induction and synchronous motors due to high inrush current. This paper will present a large oil company's challenges in starting large motors driven by the utility company in a relatively weak power system in East Texas while not violating the utility company's standards.

SELECTING THE RIGHT STRATEGY FOR STARTING LARGE MOTORS

When an AC motor is first energized, excessive current is drawn on the circuit supplying the motor, well beyond the current levels specified on the motor nameplate. High resistance is often encountered when starting a motor from a static (idle) position, and excessive current draw is necessary to begin rotation of the motor shaft.

The stator of an induction motor consists of 3-phase windings, which when connected to a 3-phase supply creates a rotating magnetic field. This will link and cut the rotor conductors

10. Starting Method for Induction Motors

It is not desirable to start large motors direct on line (giving full voltage to the stator). Normally with motors beyond 5 HP, starters are provided. For reduction in the starting current, a lower voltage is applied to the stator, especially for the squirrel cage induction motors.

Abstract: In old, large ac motors, turn insulation failure may result from rubbing of the turns against one another. A purely electrical failure might be puncture of the turn insulation (usually in line-end coils) by steep-fronted surges impinging on the motor terminals. Another mechanism which could cause a similar failure has been identified.
