Product Details. They use the same 3 wire connector, ground power and control. Regardless of how you drive your servos, be it with an RC receiver, an Arduino board, or a VEX micro-controller, the L16-R servo will function in place of a regular rotary servo, but offers linear motion. Our L16 line are constructed using an anodized aluminum shaft, metal gearbox, and steel ball bearings.

From what I can find online, the A and R servo's have the same apply area, but the R has a smaller release area which is supposed to make for a faster band release during the 2-3 shift, allowing the clutches to grab quicker and therefor a firmer, quicker 2-3 shift overall.

Servos (also RC servos) are small, cheap, mass-produced servomotors or other actuators used for radio control and small-scale robotics. Most servos are rotary actuators although other types are available. Linear actuators are sometimes used, although it is more common to use a rotary actuator with a bellcrank and pushrod.

signal for the servo. A simple circuit using a 555 timer chip can generate the needed signal. The equations for the 555 timer are simple and easy to use. They are as follows: $THIGH = 0.693(R_1 + R_2)C$ $TLOW = 0.693(R_3)C$ Since R_2 is variable the time the signal is high will vary from: $0.693(10k + 10k)0.15e-6 = 2.079mS$ to $0.693(10k + 0)0.15e-6 \dots$
