Trauma And Le Radiography

Trauma radiographers must be competent in performing mobile radiography on almost any part of the body and be able to use accessory devices (i.e., grids, air-gap technique) necessary to produce quality mobile images. Mobile fluoroscopy units, usually referred to as C-arms because of their shape, are becoming more commonplace in EDs.

Specialized trauma radiographic systems are available and are designed to provide greater greater flexibility in x-ray tube IR maneuverability. These specialized systems help to minimize the movement of the injured patient while performing imaging procedure. Mobile radiography is widely utilized in the emergency room.

One factor which will influence the contribution of radiographers to the trauma image review process is the rapid technological evolution that is occurring with radiographers and other health professionals increasingly reviewing soft copy images on a computer monitor rather than on radiographic film (hard copy).^{17, 18} The results of this study suggest that the introduction of computerised filmless systems has reduced the use of the traditional red dot sticker to highlight abnormal images and ...

Acute wrist trauma in children is one of the most frequent reasons for visiting the emergency department (ED). Radiographic imaging in children with wrist trauma is mostly performed routinely to confirm or rule out a fracture. The aim of this study was to determine how many radiographs of the wrist show a fracture in children following wrist trauma.

Clinical evaluation involving different specialities—emergency medicine, trauma surgery, orthopaedics, neurosurgery and radiology or neuroradiology—and trauma information is the most important key point in order to decide when and which type of imaging technique is indicated. 2

The role of emergency radiology in spinal trauma

Depending on the severity of cervical spine trauma, plain-film radiographs or CT imaging is adequate, with magnetic resonance imaging used as a means for further evaluation. Trauma to the thorax typically is assessed with radiography and CT, and CT is recommended for assesment of abdominal and pelvic trauma.

This is extremely rare in the case of blunt trauma and occurs rarely with penetrating trauma. Radiographic clues to this injury pattern include associated pneumomediastinum. • Valsalva maneuver against a closed glottis during blunt trauma. Again, associated pneumothorax is likely but may be small or invisible on chest x-ray. •

Abstract Computed tomography is commonly used to evaluate patients with blunt facial trauma. With the high definition of the current scanners, even small fractures of the facial skeleton can be visualized. In complex midface injuries, it can be difficult for the radiologist to know which fractures are important to point out to the surgeon.
